## IN THE CLAIMS

1. [currently amended] A process comprising:

for automatically translating a <u>formal language</u> specification <u>written in a formal language</u> defining a <u>full and complete</u> computer program to be automatically written by a computer into a <u>full and complete source code</u> computer program that <u>can be compiled</u> into a complete, executable program which can execute by itself on a computer and needs no additional third party source code or source code from existing components or code libraries to be compiled with it to make said complete executable program and which implements the requirements of said <u>formal language</u> specification, said <u>formal language</u> specification defining at least classes of objects having attributes, services and relationships with other classes, <u>said specification written in a formal language</u>, comprising <u>the following steps:</u>

using a computer, automatically write computer code that will request user name and password, receive any responses and authenticate the user;

using a computer, automatically write computer code that will determine this user's privilege level and query said formal language specification and determine all object attributes this user has privilege to see <u>and query</u> and all services this user can invoke:

using a computer, automatically write computer code which queries said formal language specification for all services of all classes that any authorized user may invoke and identifies an object server which will implement <a href="mailto:each\_said">each\_said</a> service;

using a computer, automatically write code that will retrieve service arguments for all services from <u>one or more of</u> a user, <u>an</u> <del>or from another</del> object server, <u>and or from another process</u>, as appropriate;

2	5	
2	c	

using a computer, automatically write code that <u>controls a computer to</u>
<u>display</u> displays menus options, icons or creates any other means by which <u>and</u>
<u>entity</u> a user or another process can invoke a service, and which receives input
to invoke a particular service and responds by sending a message to the
appropriate object server to invoke the service, said message including the
necessary arguments for the service to execute;

using a computer, automatically write code that implements an object server for every service, each of which first checks to verify that state transitions are valid and make sense for the current state of objects of which the object service will be altering the state-of;

using a computer, automatically write code for every object server that verifies preconditions are satisfied before making state transitions of any objects the states of which are acted upon by the object server;

using a computer, automatically write code to make all valuation calculations required by said <u>formal language</u> specification of each object server;

using a computer, automatically write code to verify that integrity constraints specified in said <u>formal language</u> specification on the values of attributes of objects have been satisfied after execution of a service and take action if said integrity constraints are not satisfied; and

using a computer, automatically write code for every object server to test trigger relationships specified in said <u>formal language</u> specification after execution of a service and carry out appropriate action if a trigger event has occurred.

2. [currently amended] An apparatus for automatically translating a formal

specification written in a formal language which has predefined rules of grammar, said
formal specification defining a computer program to be automatically written by a
computer, said translating acting to convert said formal specification into a computer
program that implements the requirements of said <u>formal</u> specification, said <u>formal</u>
specification defining at least classes of objects having attributes, services and
relationships with other classes, said specification written in a formal language,
comprising:
a computer programmed with an energing evetem and ane or more other

a computer programmed with an operating system and one or more other

programs to cooperate with said operating system to control said computer to perform
the following functions:

automatically write computer code that will request user name and password, receive any responses and authenticate the user;

automatically write computer code that will determine <u>a</u> this user's privilege level and query said formal language specification and determine all object attributes <u>said</u> this user has privilege to see <u>and query</u> and all services <u>said</u> this user can invoke;

automatically write computer code which queries said <u>formal</u> specification for all services of all classes that any authorized user may invoke and identifies an object server which will implement said service;

automatically write code that will retrieve service arguments for all services from one or more of a user, or from another object server, and or from another process, as appropriate;

automatically write code that displays <u>one or more user interface tools</u> <del>menus</del> <del>options, icons or creates any other means by which a user or another process can invoke which can be used to invoke a service, and which receives input to invoke a particular service and <u>which</u> responds by sending a message to the appropriate object</del>

server to invoke <u>said</u> the service,	said message including the n	ecessary arguments for
said the service to execute;		

automatically write code that implements an object server for every service, each of which first checks to verify that state transitions are valid and make sense for the current state of objects the object service will be altering the state of;

automatically write code for every object server that verifies preconditions are satisfied before making state transitions of any objects the states of which are acted upon by <u>said</u> the object server;

automatically write code to make all valuation calculations required by said specification of each object server;

automatically write code to verify that integrity constraints specified in said <u>formal</u> specification on the values of attributes of objects have been satisfied after execution of a service and take action if said integrity constraints are not satisfied; and

automatically write code for every object server to test trigger relationships specified in said <u>formal</u> specification after execution of a service and carry out appropriate action if a trigger event has occurred.

3. [currently amended] A computer-readable medium containing instructions for controlling a computer to automatically translate a <u>formal</u> specification defining a computer program to be automatically written by a computer into a computer program that implements the requirements of said <u>formal</u> specification, said <u>formal</u> specification defining at least classes of objects having attributes, services and relationships with other classes, said <u>formal</u> specification written in a formal language <u>having predefined</u> <u>rules of grammar</u>, by:

automatically writing computer code that will request user name and password,

9	receive any responses and authenticate the user;
10	automatically writing computer code that will determine a this user's privilege level
11	and query said formal language specification and determine all object attributes said this
12	user has privilege to see and all services said this user can invoke;
13	automatically writing computer code which queries said formal specification for all
14	services of all classes that any authorized user may invoke and identifies an object
15	server which will implement said service;
16	automatically writing computer code that will retrieve service arguments for all
17	services from one or more of a user an or from another object server, and or from
18	another process, as appropriate;
19	automatically write code that displays menus options, icons or creates any other
20	means by which a user or another process can invoke a service, and which receives
21	input to invoke a particular service and responds by sending a message to the
22	appropriate object server to invoke the service, said message including the necessary
23	arguments for the service to execute;
24	automatically writing code that implements an object server for every service,
25	each of which first checks to verify that state transitions are valid and make sense for
26	the current state of objects the object service will be altering the state of;
27	automatically write code for every object server that verifies preconditions are
28	satisfied before making state transitions of any objects the states of which are acted
29	upon by the object server;
30	automatically write code to make all valuation calculations required by said formal
31	specification of each object server;

32

33

specification on the values of attributes of objects have been satisfied after execution of

automatically write code to verify that integrity constraints specified in said <u>formal</u>

## **PATENT**

34	a service and take action if said integrity constraints are not satisfied; and
35	automatically write code for every object server to test trigger relationships
36	specified in said formal specification after execution of a service and carry out
37	appropriate action if a trigger event has occurred.
20
